At 27°C , five identical rigid 2.0 L vessels are filled with $\text{N}_2(g)$ and sealed. Four of the five vessels also contain a 0.050 mol sample of $\text{NaHCO}_3(s)$, $\text{NaBr}(s)$, $\text{Cu}(s)$, or $\text{I}_2(s)$, as shown in the diagram above. The volume taken up by the solids is negligible, and the initial pressure of $\text{N}_2(g)$ in each vessel is 720 mm Hg. All four vessels are heated to 127°C and allowed to reach a constant pressure.

1. At 127°C , the entire sample of I_2 is observed to have vaporized. How does the mass of vessel 5 at 127°C compare to its mass at 27°C ?

An experiment is performed to measure the mass percent of $\text{CaCO}_3(s)$ in eggshells. Five different samples of $\text{CaCO}_3(s)$ of known mass react with an excess of $2.0\text{ M HCl}(aq)$ in identical sealed, rigid reaction vessels.
